

HUMAN CLINICAL TISSUE LYSATES

TUMOR &
NORMAL
ADJACENT LYSATE
COLLECTION

Human Clinical Tissue Derivatives

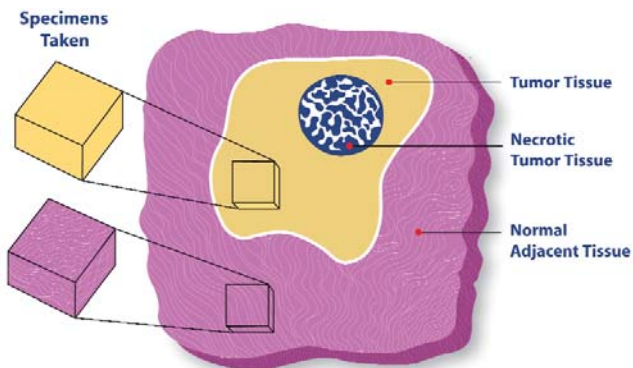

The existing body of literature has been primarily defined with data from tumor, immortal, and primary cells growing in vitro. Collectively, results obtained over decades have been integral to the dogma that up- and down-regulation of proteins can be leveraged as Biomarkers of normal development, homeostasis, and disease. However, in contrast to tissues which are composed of multiple cell types, cell lines growing in culture which theoretically consist of clonal populations. Thus, validation or modification of assay parameters collectively established from decades of cell line data in tissue lysates is key for Biomarker discovery.

IMGENEX offers comprehensive collections of ready-to-use human tissue lysates. These matched tumor and normal adjacent lysates are derived from pathology-defined clinical specimens collected under IRB and HIPAA approved protocols from hospitals around the world. High quality lysates are developed from specimens that have been flash frozen at the collection sites within minutes of removal, maintained in liquid nitrogen, and then processed using protocols optimized for extracting proteins from tissue. Tissue lysates include detailed pathology reports and are useful for a wide range of proteomic studies.

Ready-to-use clinically defined tissue lysates

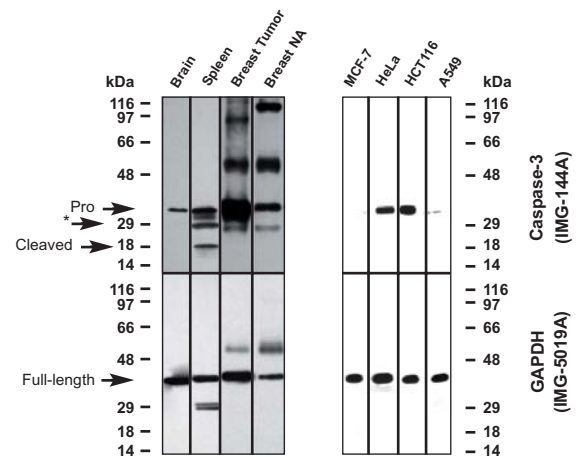

- 1D and 2D gel electrophoresis, protein-protein interactions
- Biomarker screening, antibody characterization
- Breast, lung, colon, stomach, ovary, uterus, cervix, thyroid, kidney, liver
- Tumor/normal adjacent specimens
- Western blot analysis, immunoprecipitation, ELISA
- Wide range of Proteomic applications

Tumor/Normal Adjacent Tissue Selection

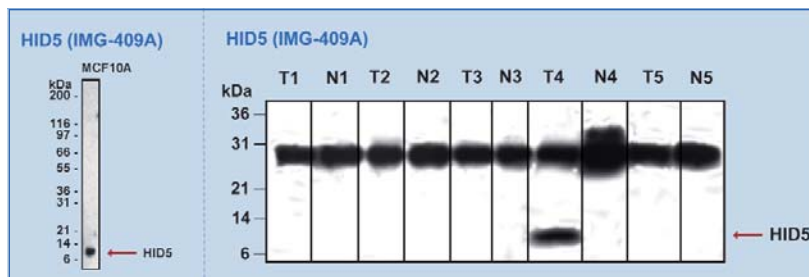

Tumor tissue specimens are cut and processed using precisely defined protocols to maximize selection of living tumor tissue while avoiding necrotic and normal tissue. Normal adjacent specimens are cut from tissue distal to the tumor, an area grossly free of tumor. All protocols used are IRB & HIPAA approved.

Differential Banding Patterns in Tissues and Cell Lines

Western blot analysis illustrates complexity of protein expression in tissues relative to cell lines.

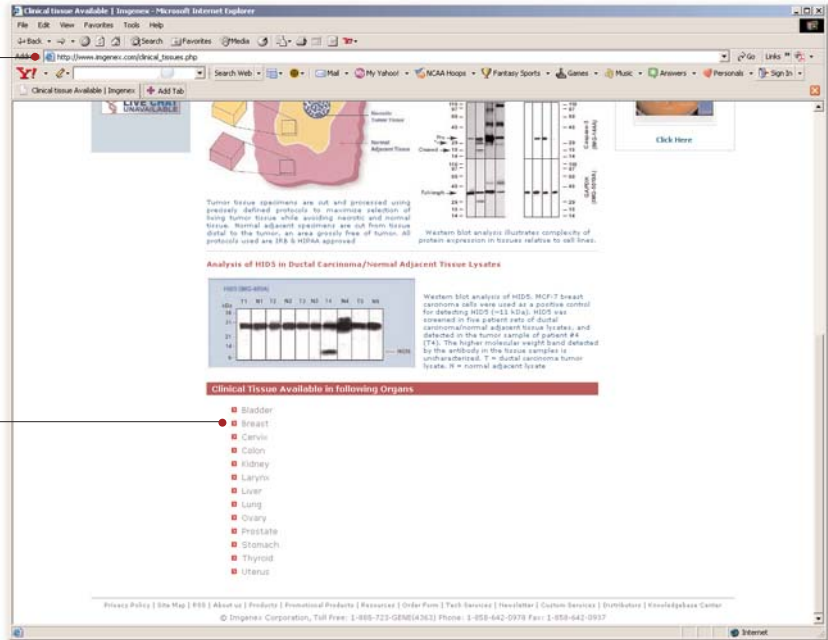

Analysis of HID5 in Ductal Carcinoma/Normal Adjacent Tissue Lysates

Western blot analysis of HID5. MCF-7 breast carcinoma cells were used as a positive control for detecting HID5 (~11 kDa). HID5 was screened in five patient sets of ductal carcinoma/normal adjacent tissue lysates, and detected in the tumor sample of patient #4 (T4). The higher molecular weight band detected by the antibody in the tissue samples is uncharacterized. T = ductal carcinoma tumor lysate. N = normal adjacent lysate.

Human Breast Tissue Lysate Bundle Set, Cat. No. C002-025

Cat. No.	Description	Units	Price
C002-025	Human Breast Tissue Lysate Bundle Set	4 Vials	600.00

Tissue Bundled Set contains the following tumor & normal adjacent lysates (below). Lysates may also be purchased individually.

Extraction 1, Soluble Protein Fraction

C002-025T1	Human Breast Tumor Tissue Lysate	0.1 mg	175.00
C002-025N1	Human Breast Normal Tissue Lysate (matched)	0.1 mg	125.00

Extraction 2, Insoluble Protein Fraction

C002-025I2	Human Breast Tumor Tissue Lysate	0.1 mg	175.00
C002-025N2	Human Breast Normal Tissue Lysate (matched)	0.1 mg	125.00

Diagnosis: Invasive ductal carcinoma **Grade:** 3

Stage: IIB **Sex:** Female

TNx: T₂N₁M₀ **Quantity:** 100

Age: 50

Concentration: 1 mg/ml

The vial is provided with a 10% overfill. Maximum recovery can be obtained by centrifuging the vial briefly to collect any solution on the cap and tube sides.

Storage: Aliquot single use volumes to avoid repeated freeze/thaw cycles. From time of receipt, this product is stable for 12 months at -70°C.

Lysate Preparation: Tissue specimens are homogenized in modified RIPA buffer to obtain the soluble proteins, and centrifuged to clarify. The pellet was further extracted with a second buffer to obtain the less soluble protein fraction. The lysate solution may appear turbid at cold temperatures due to solubility of buffer components. The solution should clear upon warming to room temperature.

Extraction 1: PBS, pH 7.4, 1 µg/ml Aprotinin, 1 mM NaF, 1 mM EDTA, 1 µg/ml Pepsstatin-A, 0.1% SDS

Modified RIPA Buffer: 0.25% Na Deoxycholate, 1 µg/ml Leupeptin, 1 mM PMSF, 1 mM Na2VO4

Extraction 2: PBS, pH 7.4, 5.0 M Urea, 2.0 M Thiourea, 50mM DTT, 0.1% SDS

Usage: These lysates are proteomic discovery tools. Researchers should validate and optimize for individual use. Potential applications may include WB, immunoprecipitation, protein-protein interactions, IgG4 binding, ELISA.

Note: For use in 1D and 2D gel electrophoresis, the addition of a denaturing gel loading buffer with reducing agents may be required.

Warranty: The products sold hereunder are warranted only to conform to the quantity and contents stated on the label at the time of delivery to the customer. There are no warranties, expressed or implied, that extend beyond the description on the label of the product. IMGENEX's sole liability is limited to either replacement of the product or refund of the purchase price. IMGENEX is not liable for property damage, personal injury, or economic loss caused by the product.

Precautions: This material has tested negative for HBsAg, HIV 1/2, and HCV. Use UNIVERSAL PRECAUTIONS when handling. Human tissue derivatives must be treated as a potentially infectious agent and disposed of appropriately.

PATHOLOGY REPORT

Catalog Numbers: C002-025

Tissue: Right breast

Location: Right breast

Diagnosis: Invasive ductal carcinoma

Stage: IIB

Grade: 3

Sex: Female

Age: 50

Gross findings: Tumor size 3 x 4 x 3 cm. Cut section hard and white/gray. Ipsilateral axillary lymph nodes examined: 9

Microscopic findings: Cancer in surgical margin of resection. Negative Multifocal carcinoma; Negative Focally muscularis/fovea invasion; Negative Chest wall invasion; Negative Breast skin (dermal) invasion; Negative Dermal Lymphatic channel invasion; Negative Skin invasion with ulceration; Negative Dermal Lymphatic channel invasion; Negative Skin satellite nodules; Negative Lymphatic and/or blood vessel invasion; Negative Tumor necrosis; Positive Number of nodes positive: 4; Tubule formation: 3; Nuclear pleomorphism: 3; Mitotic activity: 1; Lymphocyte response: Positive
